2. Summary

The purpose of this preclinical study was to evaluate the safety, effectiveness, and biocompatibility of Occlusin® 503 Artificial Embolization Device (OCL 503). This study also examined other important device-related issues including the ease of injection, extent of target vessel occlusion, rate of resorption, migration to non-target tissues, recanalization of the target vessel and local tissue reaction.

The effectiveness of OCL 503 as an artificial embolizing device (AED) was evaluated in sheep by implanting the device in either the left or right uterine artery. OCL 503 was implanted by transcatheter arterial administration and the target vessels were occluded to effective stasis. Procedural data and follow up clinical and hematological data were recorded. Test animals were sacrificed one, three, six and twelve months after embolization. The tissue responses to OCL 503 were examined histologically. Embosphere® Microspheres, a commercially available artificial embolization device, was implanted and followed as a control group.

One month post implantation, there was evidence of OCL 503 remodelling consistent with the microspheres beginning to biodegrade. Three months post implantation, the OCL 503 had undergone significant structural changes and degradation and by six months post implantation the OCL 503 microspheres had completely degraded. All OCL 503-treated arteries were completely occluded at one, three and six months post treatment. Twelve months post implantation, OCL 503-treated uterine arteries had fully recanalized in three of four treated sheep; the uterine artery of the forth animal was in the process of recanalizing.

OCL 503 microspheres were only found in the uterine vasculature. Embosphere® Microspheres were found in the uterine, vaginal, ovarian and urinary bladder vasculatures.

No device related issues or adverse events were recorded. OCL 503 was an effective and safe embolic agent when used to occlude uterine arteries in sheep

3. Introduction

3.1 Product Overview

OCL 503 is an embolotherapeutic agent consisting of poly(DL lactic-co-glycolic acid) (PLGA) microspheres that are coated with type I bovine fibrillar collagen. OCL 503 was manufactured with a size range of 150 to 212 µm.

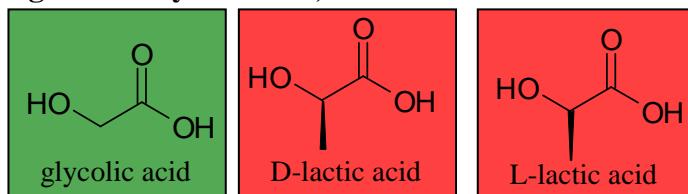

3.2 Intended Use/Indication for Use

OCL 503 is intended to be used as an artificial embolization device in the treatment of hypervascularized tumors. These tumors often arise in the liver, kidneys, and the uterus.

3.3 Characterization of the OCL 503 Microsphere Components

PLGA has long been used as suture material and more recently as a sustained-release drug delivery vehicle. PLGA is synthesized as a copolymer of glycolide and DL-lactide (Figure 1) with the ratio of the monomers governing the rate of biodegradation.

Figure 1. Glycolic acid, D-lactic acid and L-lactic acid monomers

Collagen is a family of closely related extracellular proteins that form major constituents of connective tissue of animals, giving the tissues strength and flexibility. At least 14 different types exist, each composed of tropocollagen. Tropocollagens have a common triple-helical structure but vary somewhat in composition between the separate collagen types that are localized in different tissues. Type I collagen is the most common type of collagen.

3.4 Mechanism of Action

OCL 503 acts as an embolization agent based on physical blockade of the target blood vessel(s), leading to blood stasis and subsequent clot formation. In addition, OCL 503 can promote vascular occlusion by activating platelets and consolidating clot formation.

OCL 503 uses two distinct pathways to capture and activate platelets *in vivo*. In the first pathway, collagen-specific receptors on platelets can recognize and directly bind to the collagen on the surface of the OCL 503 microspheres. Binding to the collagen activates the platelets. Platelet activation causes a complex cascade of events that result in a tight clot formation. These events include the release of chemokines, the recruitment of other platelets from the blood and platelet aggregation. In the second pathway, von Willebrand Factor (vWF) in the blood can bind to the collagen on the surface of the OCL 503 microsphere. Specific receptors on the platelets then bind to the vWF-collagen complex. Binding of the platelets to the vWF-collagen complex leads to platelet activation and clot formation as noted above.

3.5 Justification for Species Selection

The uterine organ system, vascular network, and hemostatic system of the sheep closely resemble that of humans (1). Therefore, sheep are often the species of choice for studying safety and efficacy of embolotherapeutic agents for the potential treatment of uterine fibroids (2-5).

One year old female Suffolk cross sheep were used in this study.

3.6 Justification for Study Design

Sheep were treated with OCL 503 or Embosphere® Microspheres as detailed in Table 1. Animals from each group were scheduled to be sacrificed one, three, six and 12 months post implantation. This schedule permitted an analysis of the effectiveness of OCL 503 in embolizing the targeted vasculature at various time points, a determination of when the OCL 503 microspheres biodegraded and whether the treated vasculature recanalized.

Table 1: Study Design

| Study Type | Sacrificed | Test Procedure | Test Article | Number of Animals | Sheep Number |
|---------------|----------------------------|-----------------------------|--------------------------|-------------------|--------------------------------------|
| One Month | 4 Weeks Post Embolization | Uterine Artery Embolization | OCL 503 | 4 | Y26, Y30, Y187, Y790 |
| | | | Embosphere® Microspheres | 4 | Y28, Y33, Y110, Y184 |
| Three Months | 12 Weeks Post Embolization | Uterine Artery Embolization | OCL 503 | 4 | G57, G186 ¹ , G194, G261, |
| | | | Embosphere® Microspheres | 4 | G188, G196, G253, G410 |
| Six Months | 24 Weeks Post Embolization | Uterine Artery Embolization | OCL 503 | 4 | R56 ² , R179, R193, R198 |
| | | | Embosphere® Microspheres | 4 | R27, R32, R184, R199 |
| Twelve Months | 52 Weeks Post Embolization | Uterine Artery Embolization | OCL 503 | 4 | B53, B182, B183, B346 |
| | | | Embosphere® Microspheres | 4 | B29, B34, B54, B197 |

¹Animal G186 had a spinal abscess and was sacrificed 7 weeks post embolization.

²Animal R56 was sacrificed 3 months post embolization rather than at 6 months as originally scheduled.

3.7 Justification for Number of Animals Tested

Thirty-two sheep were treated with OCL 503 or Embosphere® Microspheres as detailed in Table 1. Eight animals (four treated with OCL 503 and four treated with Embosphere® Microsphere) were scheduled to be sacrificed one, three, six and twelve months after implantation. Four animals per group provided sufficient experience to evaluate the properties of OCL 503 and Embosphere® Microspheres at each time point while minimizing the total number of animals used in the study.

3.8 Justification for Selecting the Sex of Animals Tested

Uterine artery embolization was studied in female sheep.

3.9 Study Compliance

This study was conducted at the Metabolic Unit and Ellerslie Research Facility at the University of Alberta in compliance with the Food and Drug Administration (FDA) Good Laboratory Practice (GLP) Regulations for Nonclinical Laboratory Studies (21 CFR Part 58) and applicable University of Alberta SOPs. ViRexx Medical Corp.'s Quality Assurance Unit performed quality assurance auditing and inspecting activities of procedures and analyses and reporting of findings.

The test article was manufactured in compliance with current Good Manufacturing Practices (cGMP) regulations.

The University of Alberta is accredited by both the Canadian Council on Animal Care and the Association for Assessment and Accreditation of Laboratory Animal Care and has received Animal Welfare Assurance number A5070-01 issued by the American National Institutes of Health's Office of Laboratory Animal Welfare. The University has an Institutional Animal Care and Use Committee responsible for compliance with applicable laws and regulations concerning the humane care and use of laboratory animals.

4. Study Objectives

The primary objective of this preclinical study was:

- (a) To evaluate the efficacy and safety of OCL 503 as an artificial embolization agent.

The secondary objectives of this preclinical study were:

- (a) To determine the integrity of OCL 503 in the arterial vessel one, three, six and twelve months after implantation.
- (b) To detect any toxicity associated with the implantation of OCL 503.
- (c) To determine the nature and extent of local tissue reaction to the implantation of OCL 503.
- (d) To determine the extent of recanalization of the target blood vessels.
- (e) To determine the ease of use of OCL 503 as an embolic device.
- (f) To compare the safety and efficacy of OCL 503 with that of Embosphere® Microspheres.

5. Materials and Methods

5.1 Animals

Thirty-two one year old female Suffolk cross sheep were used in the study. All animals were approximately one year old when they entered the study. Animals were weighed and paired by weight. Each pair of animals was then randomly assigned to one of four treatment groups (one month, three months, six months or twelve months). Each treatment group was assigned a unique ear tag color (one month group = yellow, three month group = green; six month group = red and 12 month group = blue) Sheep then received ear tags with a unique combination of numbers and colors to identify individual animals. One animal in each original pair was selected to be implanted with OCL 503 while the other was implanted with Embosphere® Microspheres.

5.2 Animal Care

Animals were housed at the University of Alberta under conditions consistent with all mandated provincial and national regulations. All animals received water and food *ad libitum* by qualified animal care providers. Animals received a 50% mixture of barley and alfalfa pellets when they were housed inside and timothy hay during the winter when they were housed outside. The Director of Animal Care for the Faculty of Agriculture, Forestry and Home Economics monitored animal health and veterinary care was provided as necessary.

All animals were physically examined and their vital signs recorded according to the schedule given in Appendix A. Individual animal weights are recorded in Appendix B. All animals were dewormed with Ivomec Injection (Merial Canada Ltd., Baie D'urfe, QC) and vaccinated with Tasvax 8 (Schering-Plough Animal Health, Pointe Claire, QC) annually per manufacturer's instructions.

All animals were kept in a flock on an outside pasture. One week prior to surgery, animals were brought into the barn, sheared, and housed in individual pens within sight of other sheep. Animals were kept inside until their coat was long enough or the outside temperature was warm enough for them to be released back into the outside flock. All animals were kept in the barn at least one week post surgery.

Animals were transported to and from the Metabolic Unit and the Ellerslie Research Facility for surgery in an approved animal trailer under the care of qualified animal care providers. All animals were transported to the Ellerslie Research Facility the day before surgery and returned to the Metabolic Unit the day after surgery.

All animals had a jugular cannula inserted the day prior to surgery for administration of an intravenous saline drip while anesthetized. The cannula was removed immediately following surgery.

All animals received intramuscular injections of Metacam® (0.2 mg/kg; Boehringer Ingelheim Vetmedica; Burlington, ON), a non-steroidal anti-inflammatory analgesic, on the day of surgery, the day after surgery and then as needed. The first six treated animals (Y28, Y30, Y110, Y184, Y187, and Y790) received 1 g of Ampicillin Sodium 1000 mg (Novopharm, Toronto, ON) in their intravenous drip during surgery and two intramuscular injections of 500 mg each on the day following surgery. The remaining 26 animals received Excenel® RTU Sterile Suspension (ceftiofur hydrochloride; 2 mg/kg; Pharmacia & Upjohn; Orangeville, ON) intramuscularly on the day of surgery and on the following day.

Animal G186 received intramuscular injections of Oxytetra LA (20 mg/10 kg, Citadel Animal Health, Cambridge, ON) for two days to treat an infection.

5.3 Study Design

The study design is summarized in Table I.

5.4 Hormone Induction

Veramix® sponges (Pharmacia and Upjohn) impregnated with medroxyprogesterone acetate were inserted into the vagina of each animal 13-15 days prior to surgery. The sponges were removed one day prior to surgery.

Animals received 400 international units of pregnant mare serum gonadotropin (Folligon® Injection; Intervet Canada Ltd, Whitby, ON) through an intramuscular injection one day prior to surgery.

5.5 Anesthesia and Euthanasia

5.5.1 Anesthesia. All animals were anesthetized with 5% isoflurane and maintained on ventilation at approximately 2% (+/- 0.5%) isoflurane as needed for the duration of the embolization procedure. Following the completion of surgery, the isoflurane was reduced to 0% and ventilation continued until the animals recovered from anesthesia.

5.5.2 Euthanasia. All animals were euthanized with 120 mg/kg sodium pentobarbital (Euthanyl®, Biomed-MTC Animal Health Inc., Cambridge, ON) administered intravenously in accordance with manufacturer's instructions.

5.6 Embolic Device

5.6.1 OCL 503. OCL 503 microspheres (150 – 212 µm) were manufactured at Brookwood Pharmaceuticals (Birmingham, AL) in compliance with cGMP regulations. The OCL 503 used in this study was from Lot number FL289. The contents of a vial (400 mg/vial) were suspended in 5 – 10 mL of Sodium Chloride

for Injection 0.9% USP (Appendix C lists the individual volumes). OmnipaqueTM 300 (Amersham Health) or OmnipaqueTM 240 (Amersham Health) was used as contrast agent. Omnipaque 300 was added to the suspended particles in a 3-to-1 ratio of Omnipaque 300 to Sodium Chloride for Injection ratio. The volume of Omnipaque 240 required was calculated using the following formula:

$$\text{Volume Omnipaque 240 (mL)} = \text{Volume of saline (mL)} \times 3.75.$$

5.6.2 Embosphere® Microspheres. Embosphere® Microspheres lot 286LB6 (Inter Medical Inc., Montreal, QC) with a nominal size range of 300 – 500 µm were used according to manufacturer's instructions.

5.7 Embolization Procedure

Embolization procedures were carried out under general anesthesia with femoral artery cannulation. All animals were treated by a single interventional radiologist in a similar manner with standard angiographic equipment. A 2.3F Rapid Transit Microcatheter (Cordis Corporation, Markham, ON; 29/32 sheep), a 2.3F Prowler Select Plus Microcatheter (Cordis Corporation, Markham, ON; 1/32 sheep) or a 5F Beacon Tip Torcon Advantage Catheter (Cook Incorporated, Bloomington, IN; 2/32 sheep) was directed to the uterine artery under fluoroscopic guidance. Once the position of the catheter was confirmed, either OCL 503 or Embosphere® Microspheres suspended to neutral buoyancy was injected into the target artery at the discretion of the interventional radiologist. Small increments of the embolic agent were administered until the radiologist determined that effective stasis had been achieved. Procedural data were recorded.

The interventional radiologist unilaterally treated the left (25 sheep) or right (7 sheep) uterine artery based on the architecture of each animal's arterial blood supply. Target arteries were clearly identified in all 32 animals. Embolization to effective stasis was achieved in all cases. The post procedure course was uneventful for all animals and there were no post operative complications.

5.8 Clinical Laboratory Data

Table 2 shows the parameters that were measured at baseline and at the intervals listed in the protocol study schedule (Appendix A). Three 5 mL blood samples were drawn from each animal at the specified times. All clinical laboratory analyses were conducted at Central Laboratory for Veterinarians, Ltd. (Edmonton, Canada). A qualified veterinary pathologist reviewed the data.

Table 2. Clinical Laboratory Parameters

| Total Protein | RBC Morphology |
| Uric Acid | |

5.9 Postmortem Examination

Animals were euthanized as described in Section 5.5.2. A gross examination of the target and non-target uterine arteries was performed after they were surgically exposed. A standard postmortem examination was then performed and tissues specified in Table 3 were collected for histologic examination. Tissue samples were processed and histological sections prepared by Histobest Inc. (Edmonton, AB) using standard procedures.

All carcasses were incinerated following post mortem examination and tissue collection.

Table 3. Tissues collected for histologic examination

| Heart | Uterus |
| Kidneys | Vagina |
| Large Intestine (with Rectum) | Vaginal Arteries |
| Any abnormal tissues observed at the gross necropsy | |

5.10 Statistical Analysis

An appropriate analysis of the safety and biological data developed in this preclinical study was performed. Safety analyses were based on the clinical and laboratory effects observed in treated animals. The statistical analysis was primarily descriptive. Statistical significance for the surgical time for implantation, fluorographic time and vials required for effective stasis was determined with the one-tailed Student's t-test.

5.11 Key Personnel

Dr. Richard Owen, M.D., F.R.C.P.(C), an interventional radiologist at the University of Alberta Hospital, performed all device implantation procedures and made the determination that effective stasis of blood flow to the target organ had been achieved. Dr. P. N. Nation, D.V.M., Ph.D., a board certified veterinary pathologist, performed all necropsies and interpreted all Clinical Laboratory data, gross pathologies and histological analyses. The resumes for Drs. Owen and Nation are included in Appendix X.

6. Results

6.1 Embolization

All animals were healthy at the time of embolization and were examined, weighed, and blood samples drawn in accordance with the Study Schedule (Appendix A). Individual and group mean weights are recorded in Appendix B. Data recorded during the embolization procedure are listed in Appendix C.

The left or right uterine artery was embolized with OCL 503 or Embosphere® Microspheres using a femoral approach. The devices were administered through standard microcatheters.

Although it took significantly longer to surgically implant (time from insertion of the catheter to its removal) OCL 503 than Embosphere® Microspheres (Table 4; p=0.0002), the fluorographic time required to achieve effective stasis was not significantly different for sheep implanted with either device (Table 5, p=0.32). The mean number of vials and the range of vials required to reach effective stasis in both treatment groups were not significantly different (Table 6, p=0.31).

Table 4. Total surgical time to implant each device

| Treatment Group | Number of sheep | Minutes (Mean \pm 1 SD) |
|--------------------------|-----------------|---------------------------|
| OCL 503 | n = 14 | 18.4** \pm 5.7 |
| Embosphere® Microspheres | n = 14 | 9.6 \pm 3.2 |

**Significantly different: p=0.0002, single tailed Student's t-test

Note that the fluorographic time was only recorded in 88% of the treated sheep (28/32 of total sheep; 14/16 in each treatment group).

Table 5. Fluorographic time to achieve effective stasis in each group of sheep

| Treatment Group | Number of sheep | Minutes (Mean \pm 1 SD) |
|--------------------------|-----------------|---------------------------|
| OCL 503 | n = 8 | 8.9 \pm 2.7 |
| Embosphere® Microspheres | n = 8 | 8.1 \pm 3.6 |

Not significantly different: p=0.32, single-tailed Student's t-test

Note that the fluorographic time was only recorded in 50% of the treated sheep (16/32 of total sheep; 8/16 in each treatment group).

Table 6. Number of vials required to achieve effective stasis

| Treatment Group | Number of sheep | Vials (Mean \pm 1 SD) | Vials (Range) |
|--------------------------|-----------------|-------------------------|---------------|
| OCL 503 | n = 16 | 0.8 \pm 0.3 | 0.4 – 1.3 |
| Embosphere® Microspheres | n = 16 | 0.9 \pm 0.3 | 0.3 – 1.6 |

Not significantly different: p=0.31, single-tailed Student's t-test

6.2 Animal Health

Sheep G186 developed an infection in the neck one day after surgery at the site of the jugular cannula used for an intravenous drip. The animal was treated with hot compresses, Excenel (six days), and Oxytetra LA for two days. In addition, an abscess in the neck was lanced and flushed with betadine. The infection appeared to resolve within 8 days. Three weeks after surgery, G186 began to exhibit signs of walking stiffly. Clinical signs became more pronounced over time and the sheep had limited mobility and eating. Although scheduled to be sacrificed 3 months after treatment, the study veterinarian put G186 down 7 weeks after surgery to minimize its suffering. Post-mortem examination showed that this animal had a spinal

abscess that caused the clinical signs. This was interpreted to have arisen by extension from the infection at the site of cannulation. The abscess was unrelated to implantation of OCL 503.

All other sheep were in good health and were euthanized as scheduled.

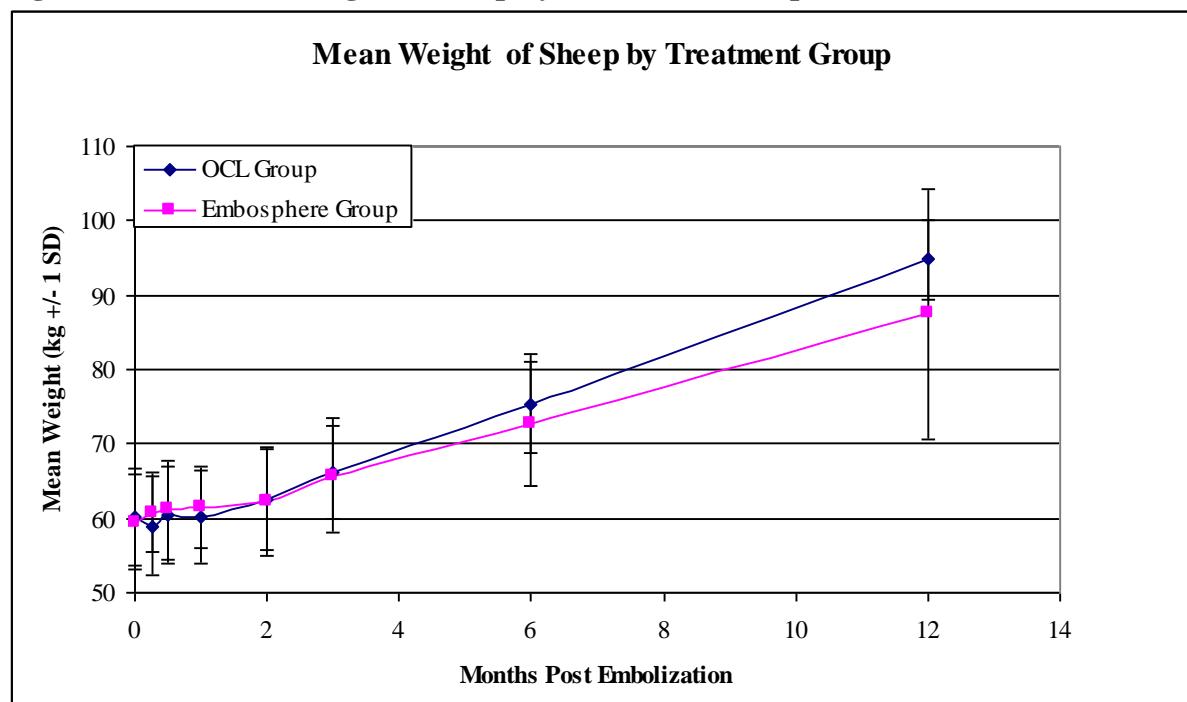

6.3 Animal Weights

The sheep with the spinal abscess (sheep number G186), lost 10 kg in weight over the last three weeks of its life due to its decreased mobility and lack of food consumption. This weight loss was unrelated to treatment with OCL 503. The weight of each sheep over the course of the study is presented in Appendix B.

There was some fluctuation in weight of individual animals between their pre-treatment weight and their weights at one week and two weeks post surgery and again at 1 month post implantation (Appendix B). This variability is due in part to their response to the surgery and in part to being fed *ad libitum* in the barn and then being moved back to the pasture to graze.

The mean weight of sheep in each treatment group is shown in Figure 2. Both of the groups gained weight with time and the rate of weight gain was similar. The sheep implanted with Embosphere® Microspheres appear to gain weight more slowly than sheep treated with OCL 503 from six to twelve months after

Figure 2. The Mean Weight of Sheep by Treatment Group

Note: The error bars represent one standard deviation (SD).

implantation. This lower weight gain is due primarily to the loss of 3 kg in weight by sheep number B29 while all other sheep gained between 12 and 26 kg during this period (Appendix B). Sheep B29 was in good health at the time of sacrifice and no physiological reason was identified for its failure to gain weight.

6.4 Clinical Laboratory Data

Blood samples were collected the day before surgery and again 1 day, 7 days, 14 days, 1 month, 2 months, 3 months, 6 months and 12 months after embolization. The clinical laboratory units and standard reference range used by Central Laboratory for Veterinarians, Ltd. are provided in Appendix D. An Internal Reference Range, the range of clinical laboratory data on day -1 for the thirty-two sheep used in this study, is also provided in Appendix D. This internal reference range is the most appropriate to use in assessing individual variations in hematology and clinical chemistry values.

Graphs of the means of the clinical laboratory data for each group of animals (sheep implanted with OCL 503 and sheep implanted with Embosphere® Microspheres) are presented in Appendices K to P.

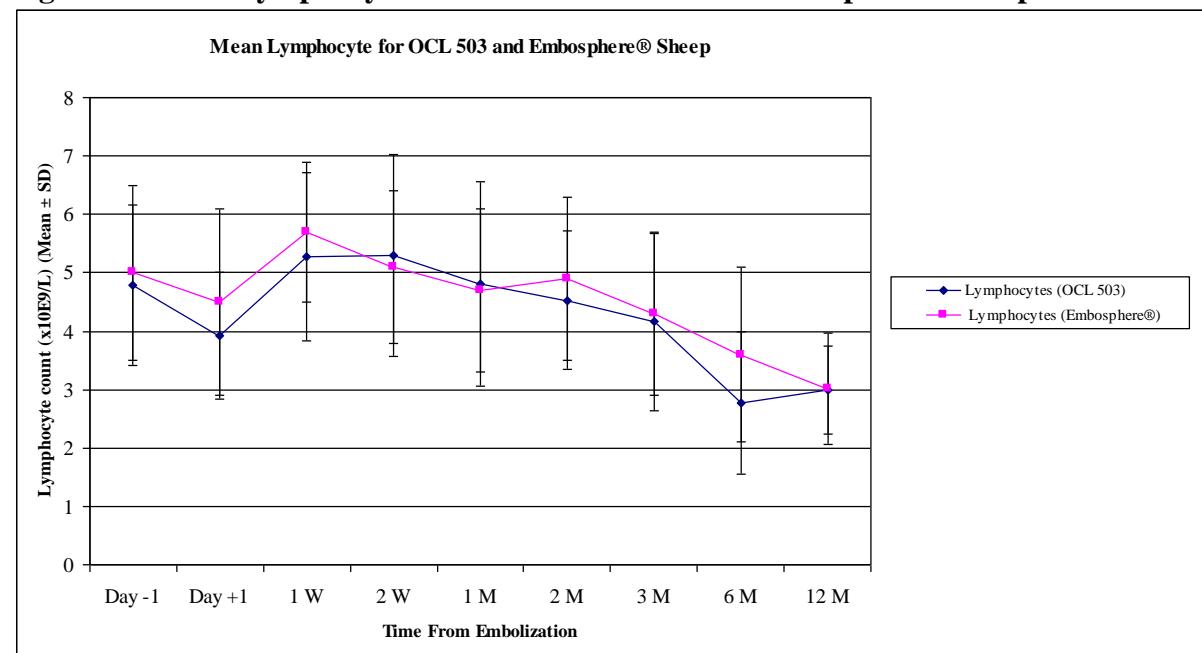

The laboratory parameters means that changed following implantation are discussed below.

6.4.1. Hematology. The mean lymphocyte count decreased one day after implantation, rebounded slightly above pre-implantation values one week after implantation and then gradually decreased with time (Figure 3). The mean values for the OCL 503 and Embosphere® Microspheres groups were similar and fell within the pre-treatment internal standard reference range (Appendix D).

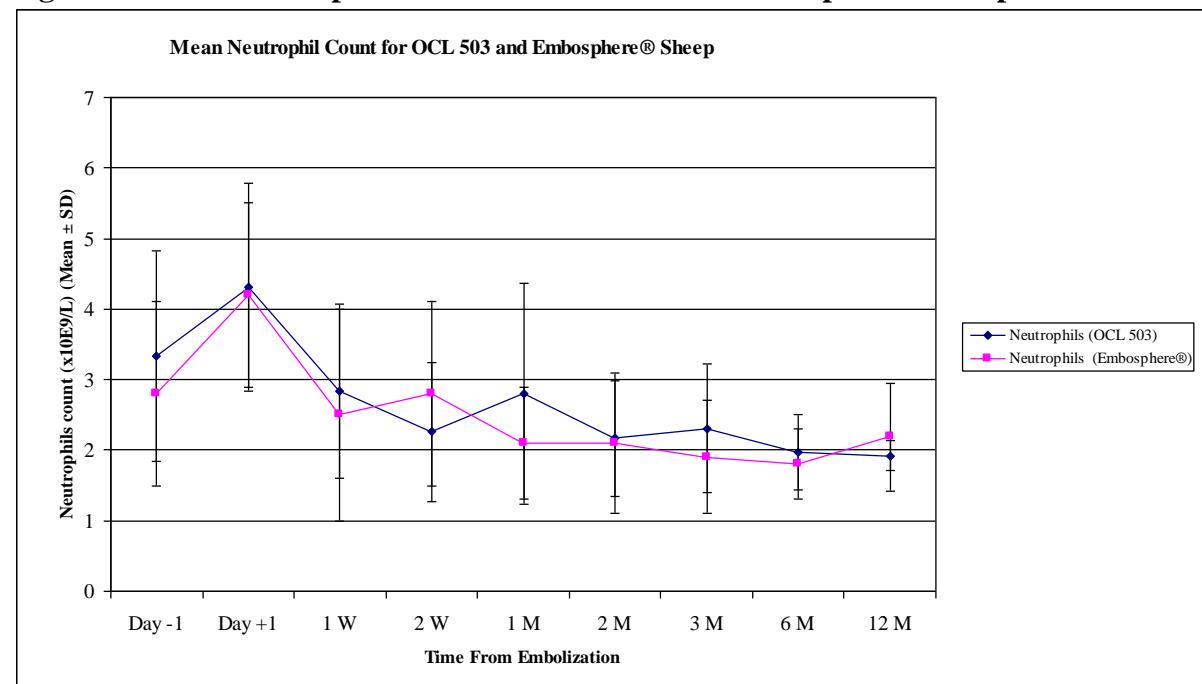

The mean number of neutrophils increased one day after implantation, decreased to slightly below pre-implantation values one week after implantation and then decreased with age (Figure 4). The mean values for the OCL 503 and Embosphere® Microspheres groups were similar and fell within the pre-treatment internal standard reference range (Appendix D).

6.4.2 Chemistry. The mean blood urea nitrogen/creatinine (BUN/Cr) ratio decreased one day after implantation, rebounded above pre-implantation values by one week after implantation and remained elevated in both groups thereafter (Figure 5). The mean values for the OCL 503 and Embosphere® Microspheres groups were similar and fell within the pre-treatment internal standard reference range (Appendix D).

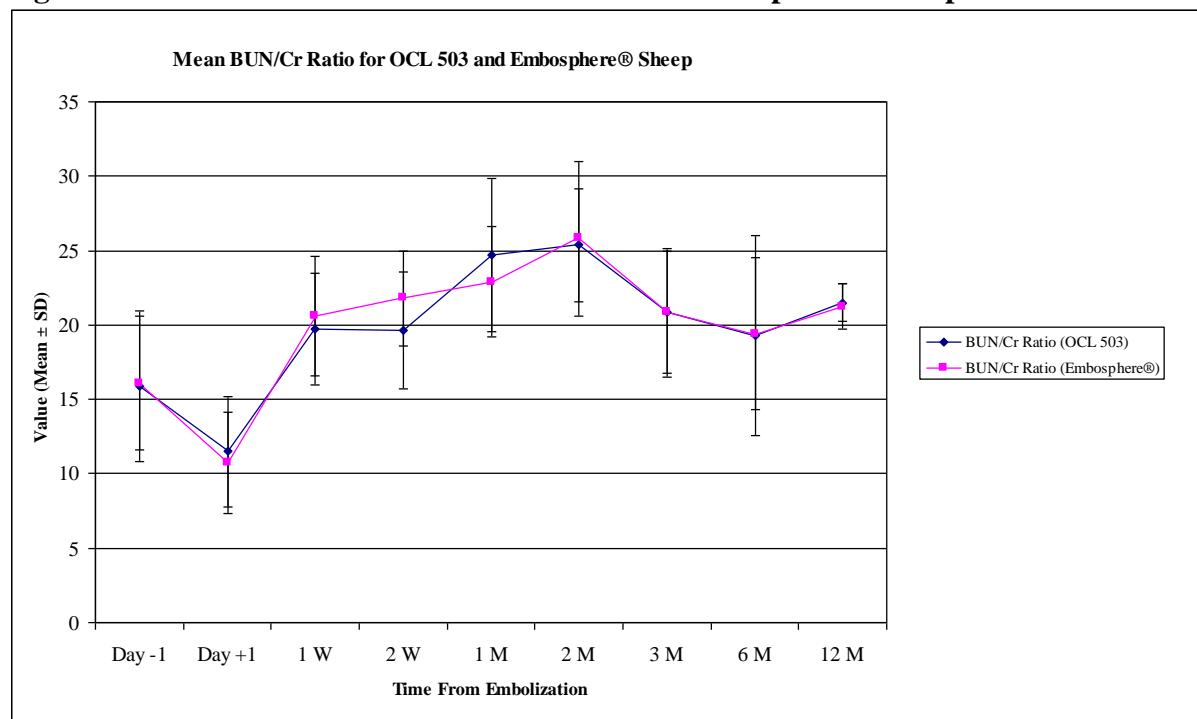

The mean sorbital dehydrogenase-AO levels increased sharply one day after implantation but returned to normal by one week post implantation (Figure 6). The mean values for the OCL 503 and Embosphere® Microspheres groups were similar. The values for individual animals implanted with OCL 503 and Embosphere®

Figure 5. Mean BUN/Cr Ratio for OCL 503 and Embosphere® Sheep

Source: Appendix 0, panels a and b

Figure 6. Mean Sorbital Dehydrogenase-AO Levels for OCL 503 and Embosphere® Sheep

Source: Appendix 0, panels a and b

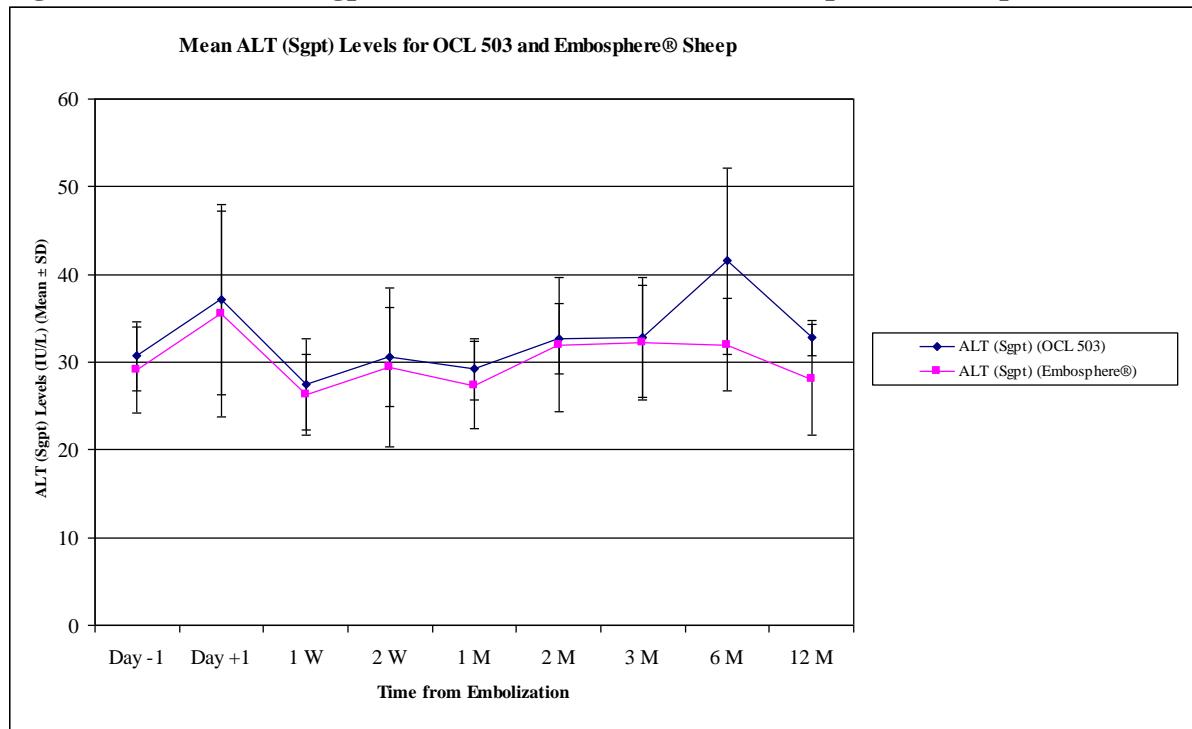

Microspheres are shown in Appendix Q. Seven of sixteen OCL 503-implanted sheep showed an increase in sorbital dehydrogenase one day after implantation while the remaining nine of sixteen animals had relatively minor increases (Appendix Q, panel a). Fifteen of sixteen Embosphere® Microspheres-implanted sheep had modest increases in Sorbital Dehydrogenase while one of sixteen had a substantial increase (Appendix Q, panel b).

The mean ALT (Sgpt) levels increased one day after implantation, decreased to or below pre-implantation values by one week post-implantation (Figures 7). The mean values for the OCL 503 and Embosphere® Microspheres groups were similar. The values for individual animals implanted with OCL 503 and Embosphere® Microspheres are shown Appendix R.

The trends for the OCL 503 and Embosphere® Microspheres Sheep were similar. Each individual change had resolved itself by the next laboratory examination. All changes were within the pre-treatment internal standard reference range (Appendix D).

The mean AST (Sgot) levels increased one day after implantation, decreased to or below pre-implantation values by one week post-implantation (Figures 8). The mean values for the OCL 503 and Embosphere® Microspheres groups were similar. All means fell within the pre-treatment internal standard reference range (Appendix D). The values for individual animals implanted with OCL 503 and Embosphere®

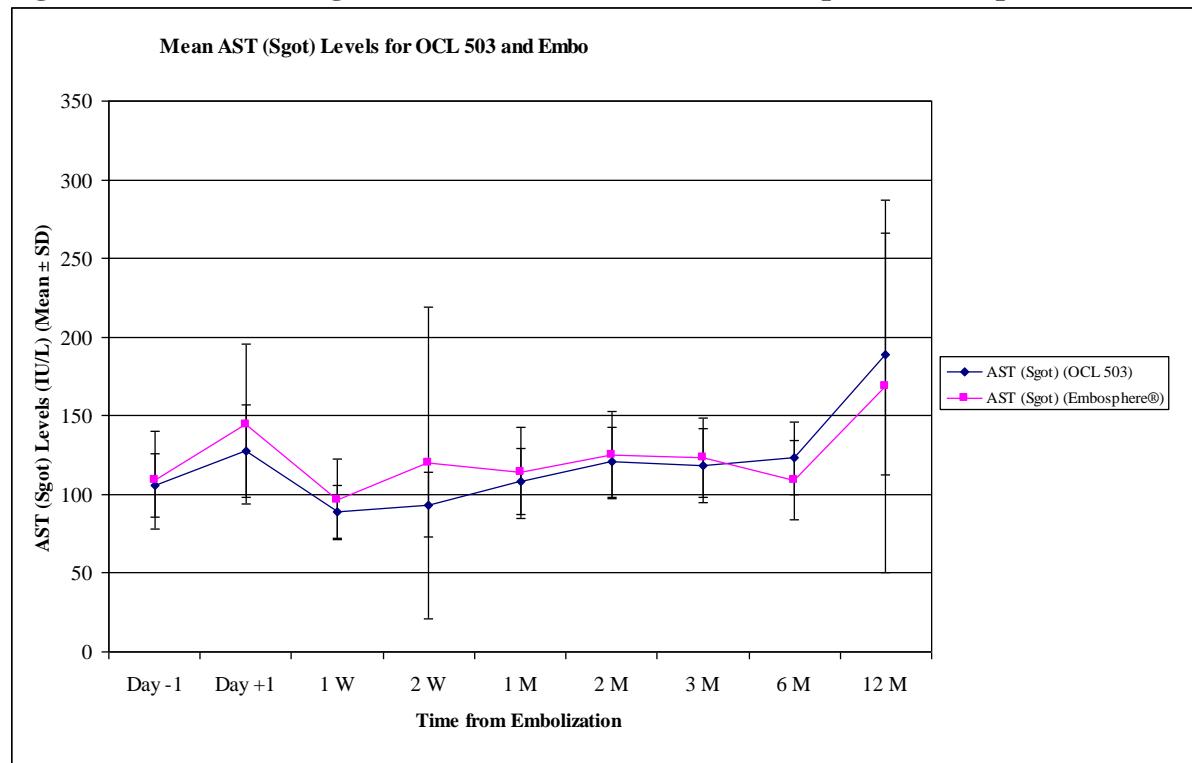

Figure 7. Mean ALT (Sgpt) Levels for OCL 503 and Embosphere® Sheep

Source: Appendix O, cont., panels c and d

Microspheres are shown in Appendix S. The trends for the OCL 503- and Embosphere® Microspheres-treated sheep were similar. The AST (Sgot) level increased from 130 IU/L one week post implantation to 438 IU/L two weeks after implantation in Embosphere® Microspheres-treated sheep number B34 (Appendix H14, Appendix S). The cause of this increase in sheep B34 is unknown. The values returned to 140 IU/L one month post implantation (Appendix H14).

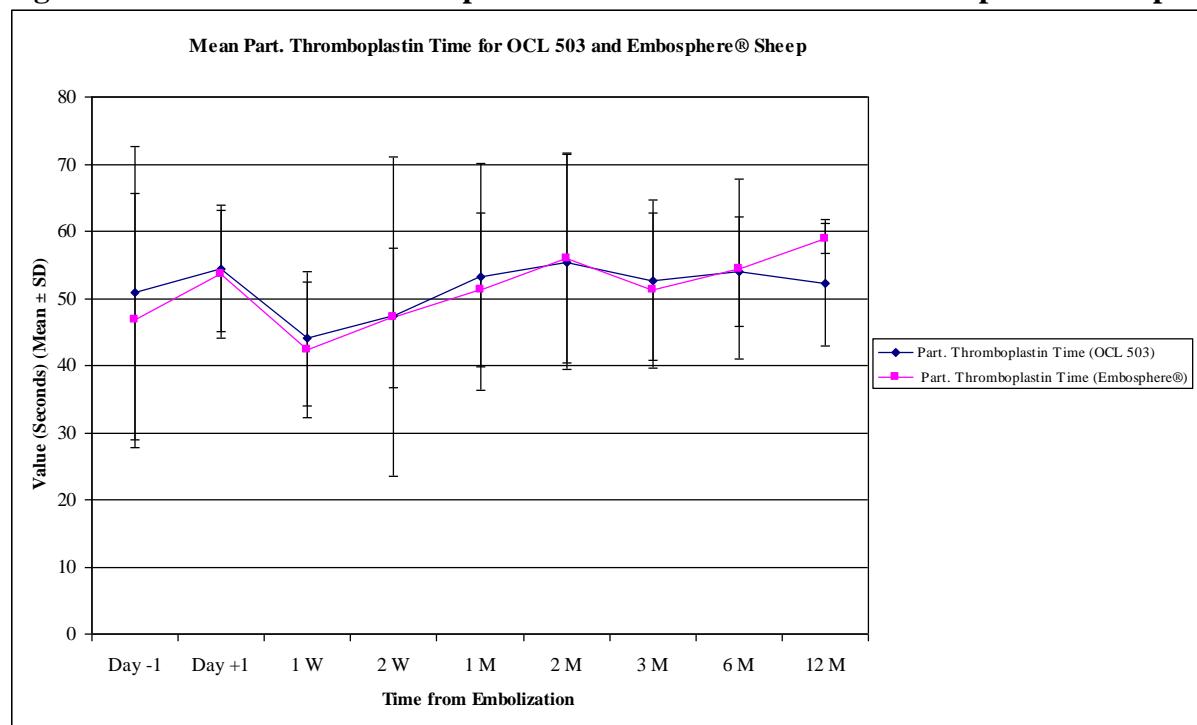

Figure 8. Mean AST (Sgot) Levels for OCL 503 and Embosphere® Sheep

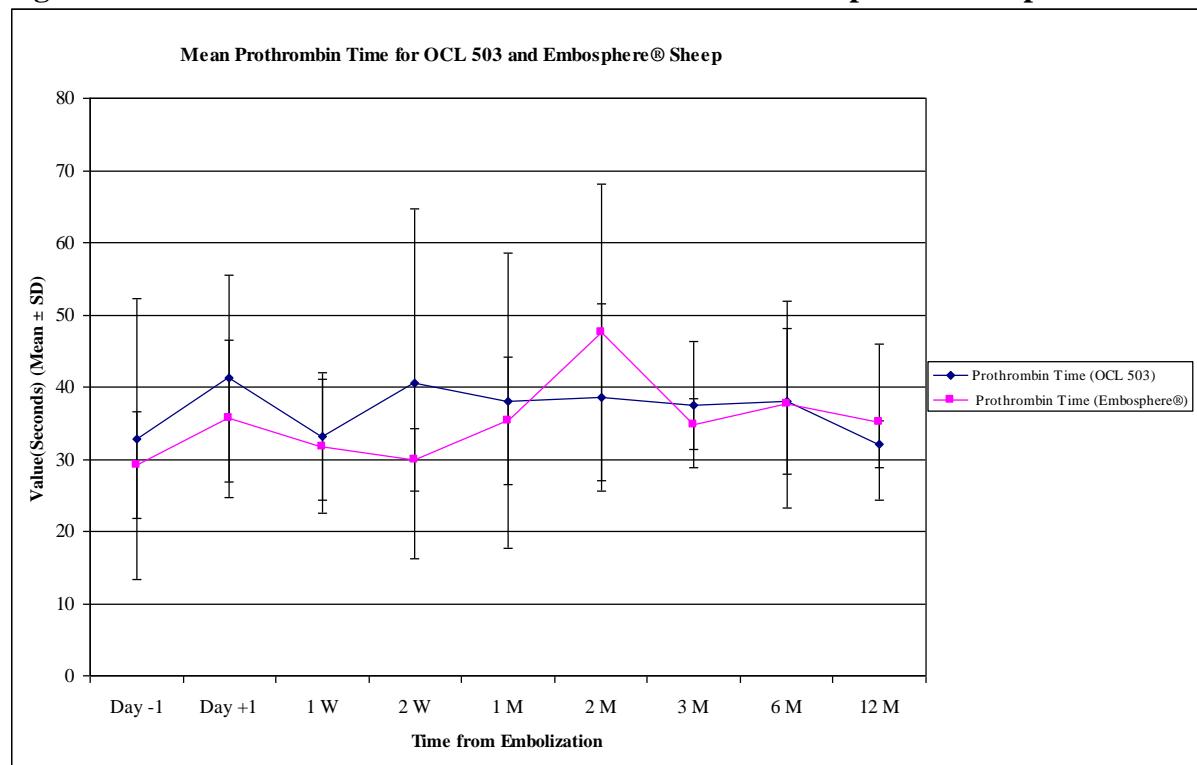

Source: Appendix O, cont., panels c and d

6.4.3 Coagulation. The mean partial thromboplastin time increased one day after implantation, decreased to or below pre-implantation values by one week post-implantation and then increased gradually with time (Figure 9). The mean values for the OCL 503 and Embosphere® Microspheres groups were similar. All means fall within the pre-treatment internal standard reference range (Appendix D). Due to the large error bars, the values for individual animals implanted with OCL 503 and Embosphere® Microspheres are shown in Appendix T. Although there is significant variation in Partial Thromboplastin time during the study in individual animals, all values fell within the pre-treatment reference range established in this study (Appendix D).

The prothrombin time increased one day after implantation but fell to or below pre-implantation values by one week post-implantation (Figure 10). The mean values for the OCL 503 and Embosphere® Microspheres groups were similar. All means fall within the pre-treatment internal standard reference range (Appendix D). Due

Figure 9. Mean Partial Thromboplastin Time for OCL 503 and Embosphere® Sheep

Source: Appendix O, panels c and d

Figure 10. Mean Prothrombin Time for OCL 503 and Embosphere® Sheep

Source: Appendix O, panels c and d

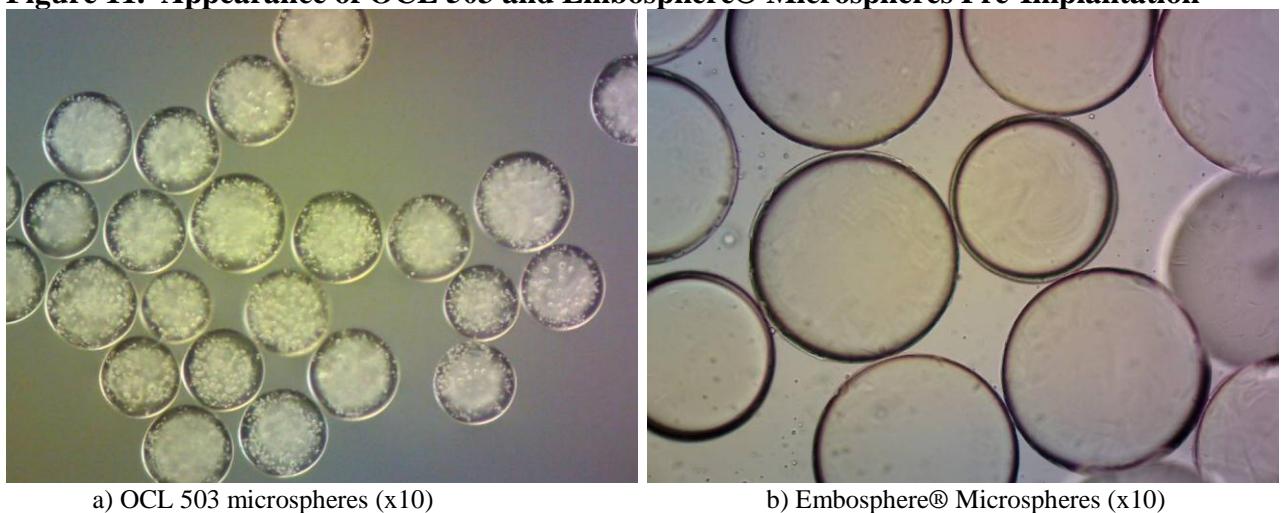

to the large error bars, the values for individual animals implanted with OCL 503 and Embosphere® Microspheres are shown in Appendix U. Although there is significant variation in prothrombin time through the study, all values fell within the pre-treatment reference range established in this study (Appendix D).

6.4.4. Raw Clinical Laboratory Data. The clinical laboratory data for each sheep implanted with OCL 503 for all sample days are listed in Appendix E. The summary clinical laboratory data for all sheep implanted with OCL 503 are provided for each sampling day (Day -1, Day +1, 1 Week, 2 Weeks, 1 Month, 2 Months, 3 Months, 6 Months and 12 Months) in Appendix F. The mean and standard deviations for the clinical laboratory data for all days for sheep implanted with OCL 503 are given in Appendix G. The corresponding clinical laboratory data for the sheep implanted with Embosphere® Microspheres are provided in Appendices H, I and J, respectively. Data outside the normal reference range used by Central Laboratory for Veterinarians are shown in the tables in bold. It should be noted that the Internal Reference range for sheep in this study is broader than the reference range used by Central Laboratory for Veterinarians. This may be due to a more limited number of sheep in the Central Laboratory for Veterinarians database or that the sheep are housed under different conditions. Most of the values that exceed the Central Laboratory for Veterinarians reference range fall within the normal internal reference range for the sheep in this study.

6.5 Histopathological Findings

Implantation of OCL 503 and Embosphere® Microspheres caused complete occlusion of the treated artery. One month after implantation, all treated arteries stood out as a thick, rope-like, cords that were hard to the touch. Three and six months post implantation, the arteries treated with OCL 503 were still firm and distended and could be clearly distinguished from the contralateral untreated arteries, although the differences were less at six months than at three months post treatment. By twelve months post implantation, the uterine arteries treated with OCL 503 were visually indistinguishable from the untreated contralateral arteries. The Embosphere® Microspheres-treated arteries remained unchanged throughout the study.

A photomicrograph of the OCL 503 microspheres and Embosphere® Microspheres pre-implantation is shown in Figure 11. Photomicrographs of cross-sections of the treated uterine arteries at one, three, six and twelve months post-implantation with OCL 503 or Embosphere® Microspheres are presented in Figures 12 to 15. As can be seen in Figure 12a, the initially spherical OCL 503 microspheres showed profound shape changes one month after implantation as they were compressed in the artery and began to biodegrade. Figures 12a and 13a reveal that fibrous connective tissue formed around and between OCL 503 microspheres and held them in place as the microspheres underwent biodegradation. Figure 14a shows that the fibrous connective tissue appears to have replaced the inner luminal wall of the artery, which remained completely occluded six months post implantation, even

Figure 11. Appearance of OCL 503 and Embosphere® Microspheres Pre-Implantation

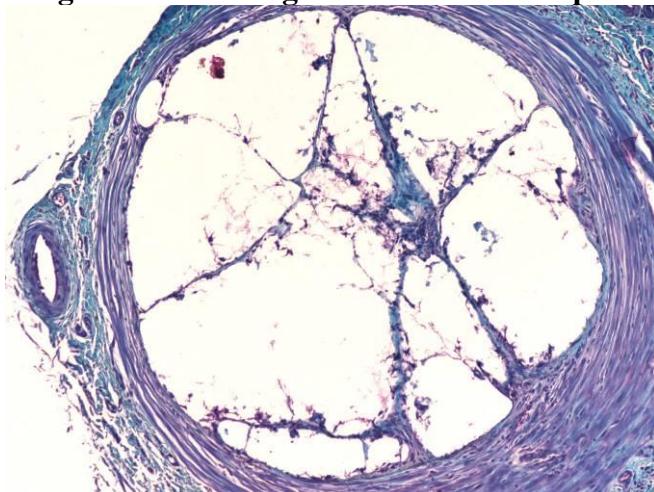

This phase contrast photomicrograph is representative of the microspheres implanted in this study. Note the size variation in both devices.

though the OCL 503 microspheres have completely degraded. Figure 15a and Figure 16 demonstrate that the treated uterine arteries had either fully recanalized or were in the process of being recanalized twelve months after implantation with OCL 503. The histological appearance of the Embosphere® Microspheres-treated arteries remained unchanged throughout the twelve month observation period (Figures 12b to 15b).

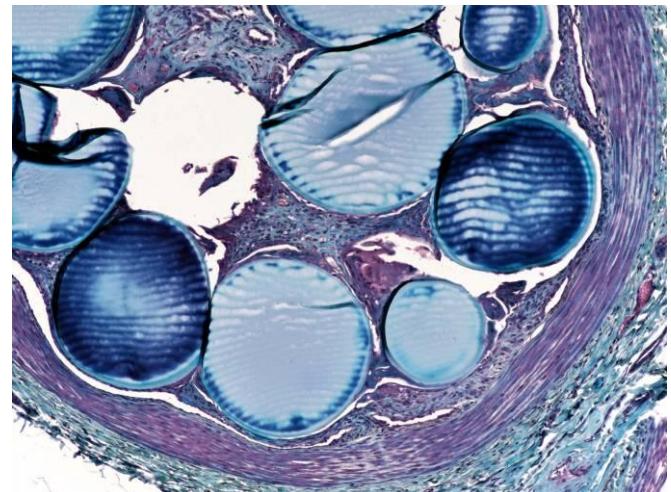

OCL 503 microspheres were found in the lumen of the treated artery (Figure 12a) as well as the branches of the treated uterine artery as distal as the wall of the uterus along the mesenteric attachment. As detailed in Appendix V and summarized in Figure 17, OCL 503 microspheres were also found occluding the untreated contralateral uterine arterioles.

Embosphere® Microspheres had a similar qualitative distribution in the uterine vasculature to that of the OCL 503 microspheres. Embosphere® Microspheres were also detected in the contralateral untreated uterine, vaginal, ovarian and urinary bladder vasculatures (see Figure 17). The presence of Embosphere® Microspheres is denoted as “yes” or “few.” In general, “yes” indicates that Embosphere® Microspheres were readily apparent and were numerous enough to have occluded the main artery or larger arterioles of the affected organ while “few” indicate that a smaller number of Embosphere® Microspheres were occluding smaller arterioles. This was not a quantitative analysis and only a few sections were examined in each organ system

Figure 17 graphically presents the percentage of treated sheep in which occluded arteries were identified by histopathological examination. Both OCL 503 (12/12) and Embosphere® Microspheres (16/16) completely occluded the artery in which

Figure 12. Histological Sections of Sheep Uterine Arteries One Month after Treatment

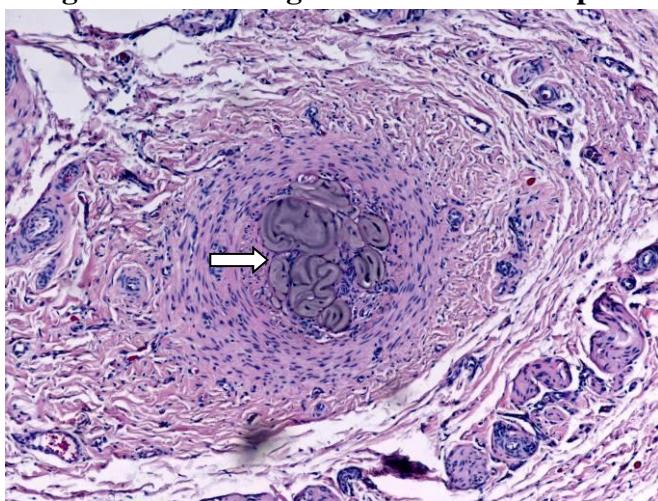

12a) Implanted OCL 503 Microspheres (x100)

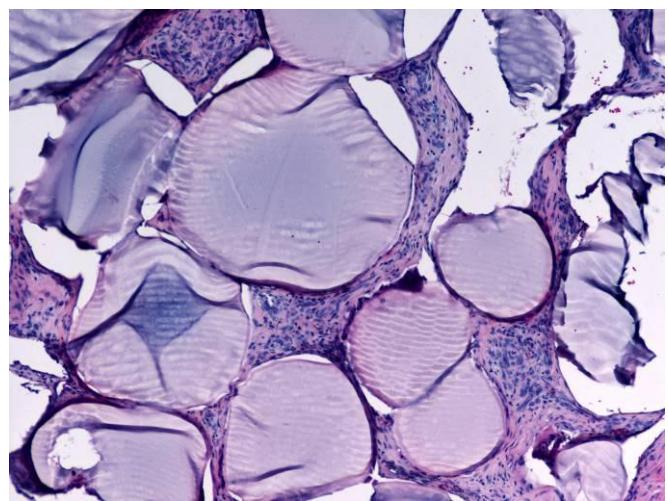

12b) Implanted Embosphere® Microspheres (x100)

One month after implantation, uterine arteries treated with Occlusin® 503 AED or Embosphere® Microspheres were fully occluded. The initially spherical OCL 503 microspheres showed profound shape changes as they were compressed in the artery and began to biodegrade. The OCL 503 microspheres did not stain and appear as white, irregular, shapes. In contrast, the Embosphere® Microspheres retained their spherical shapes and stain blue.

Note: the folding and rippling appearance of the surface of the Embosphere® Microspheres are artifacts of the tissue sectioning.

Figure 13. Histological Sections of Sheep Uterine Arteries Three Month after Treatment

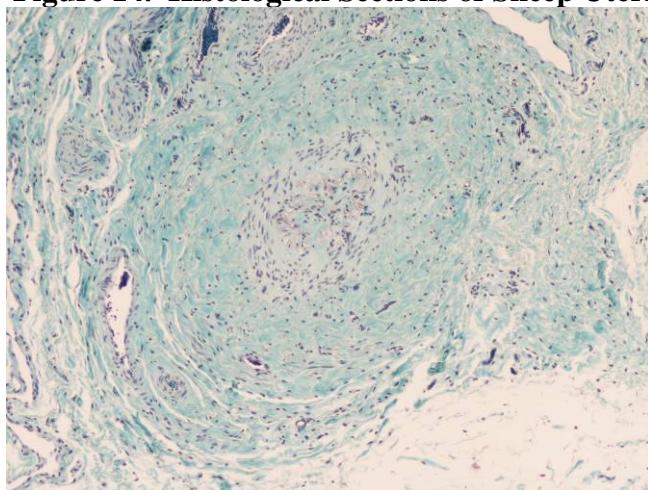

13a) Implanted OCL 503 microspheres (x100)

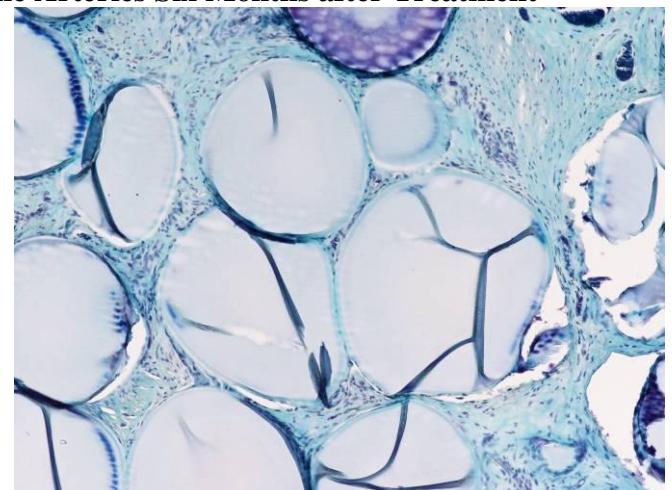

13b) Implanted Embosphere® Microspheres (x100)

Three months after implantation, uterine arteries treated with Occlusin® 503 AED or Embosphere® Microspheres remained fully occluded. There were no identifiable intact OCL 503 microspheres. The residual material was highly deformed and compressed in the center of the artery as it continued to degrade (arrow). In other sections, even less OCL 503 microsphere material was visible. In contrast, the Embosphere® Microspheres retained their round shapes and the artery remained highly distended.

Note: the folding and rippling of the surface of the Embosphere® Microspheres are artifacts of the tissue sectioning.

Figure 14. Histological Sections of Sheep Uterine Arteries Six Months after Treatment

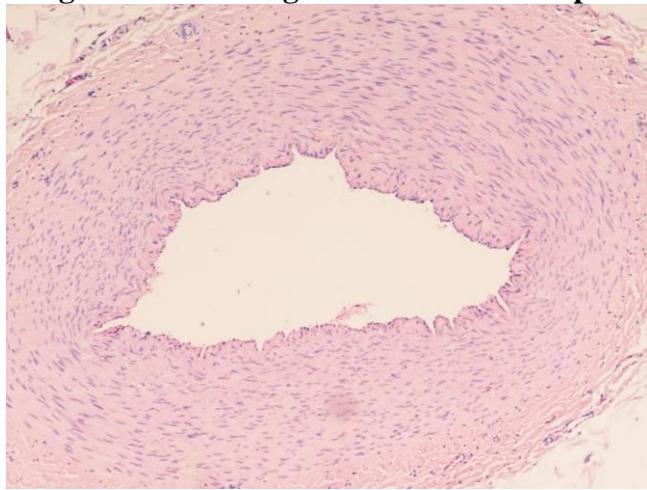

14a) Implanted OCL 503 microspheres (x100)

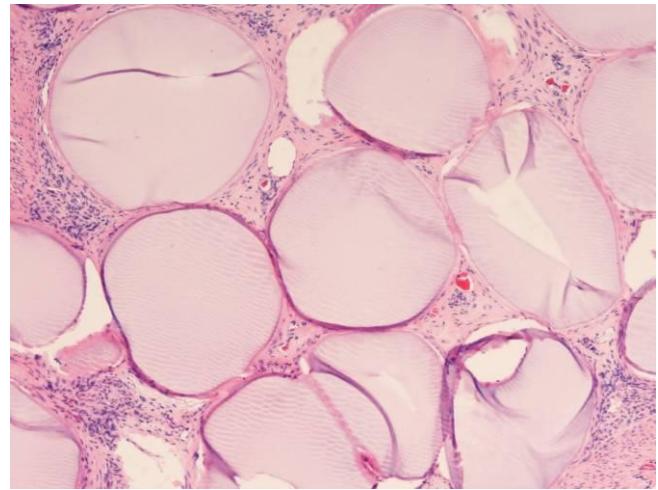

14b) Implanted Embosphere® Microspheres (x100)

Six months after implantation, uterine arteries treated with Occlusin® 503 AED or Embosphere® Microspheres remained fully occluded. The inner luminal wall of the artery treated with OCL 503 microspheres was replaced by fibrous connective tissue. No residual OCL 503 microspheres were observed six months after implantation. In contrast, the Embosphere® Microspheres retained their round shapes and the artery remained highly distended. Connective tissue was present between the Embosphere® Microspheres.

Note: the folding and rippling of the surface of the Embosphere® Microspheres are artifacts of the tissue sectioning.

Figure 15. Histological Sections of Sheep Uterine Arteries Twelve Months after Treatment

15a) Implanted OCL 503 microspheres (x100)

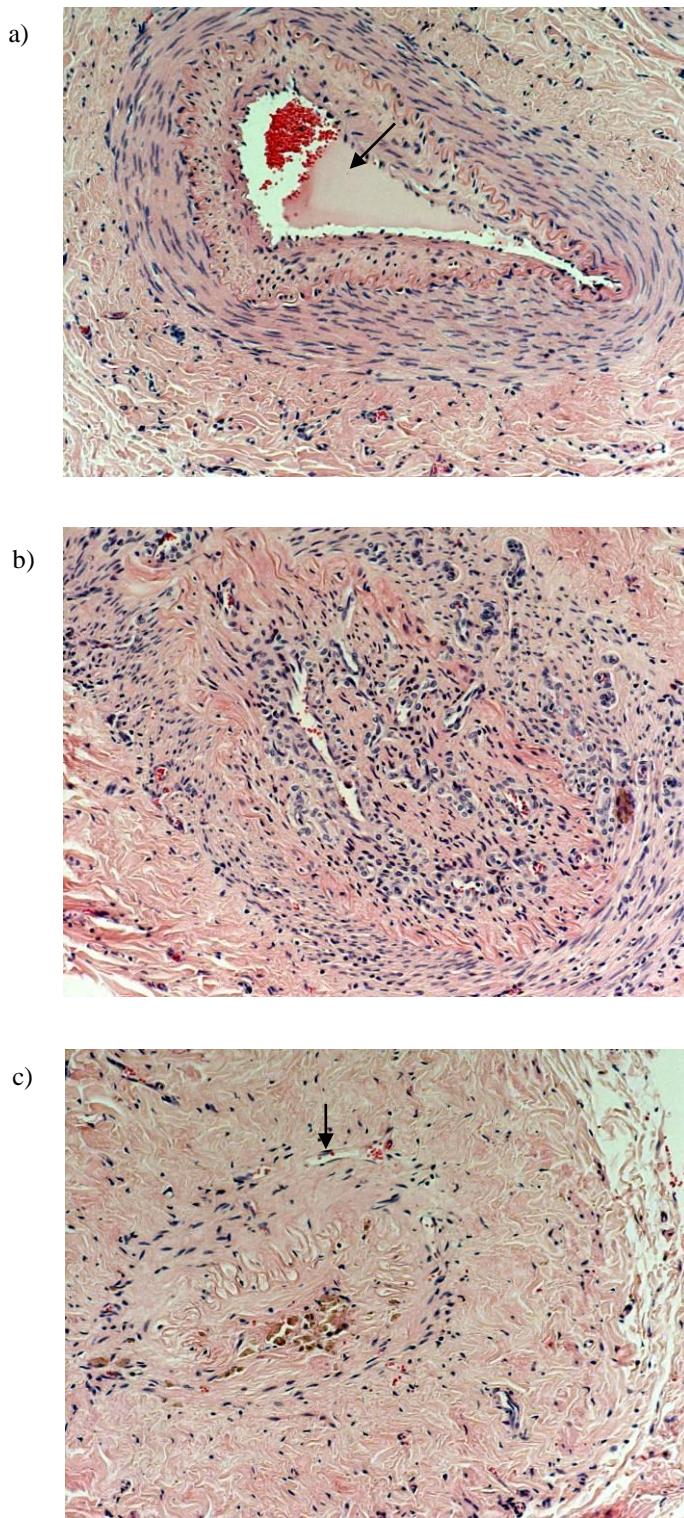

15b) Implanted Embosphere® Microspheres (x100)

Twelve months after implantation into the sheep uterine artery, the lumen of the uterine artery treated with OCL 503 microspheres was fully recanalized in 3 of 4 sheep. In contrast, the artery treated with Embosphere® Microspheres remained fully occluded.

Note: the folding and rippling of the surface of the Embosphere® Microspheres are artifacts of the tissue sectioning.

Figure 16. Histological Sections of Sheep B183 Left Uterine Artery Twelve Months after Treatment

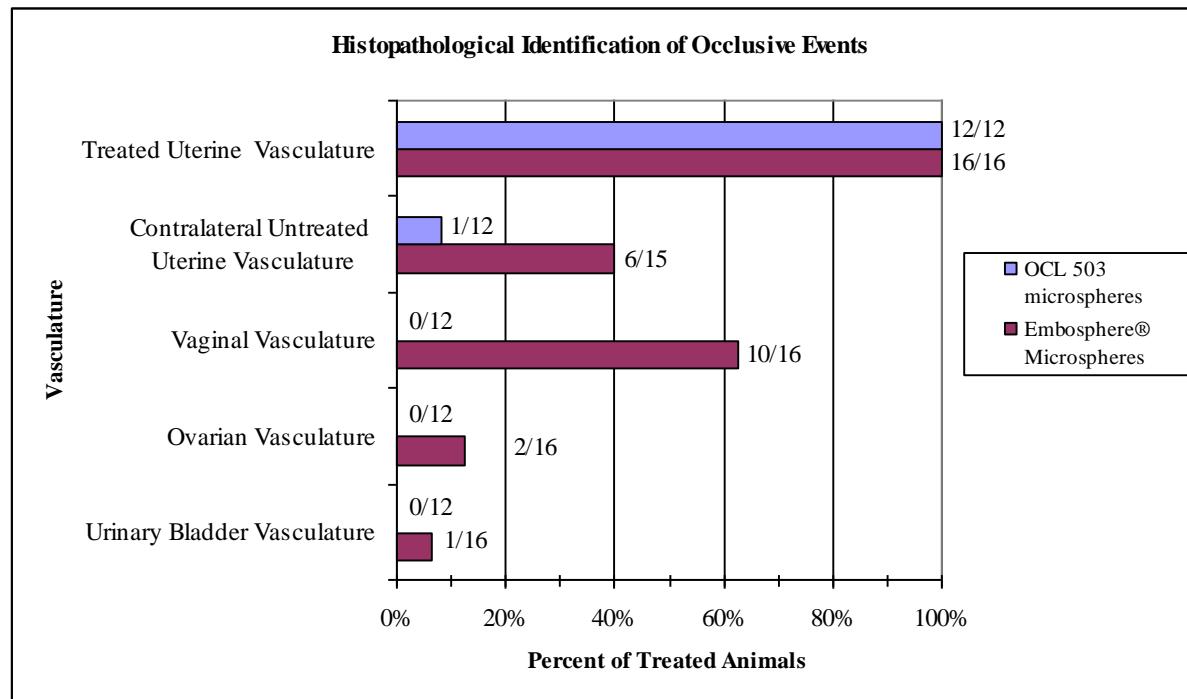

Panel a shows a section of the left uterine artery of sheep B183. The artery has been recanalized and contained blood as confirmed by the presence of red blood cells and precipitated serum proteins (arrow). Although patent, the arterial lumen was smaller than that seen in recanalized arteries in other animals (Figure 15a). The precipitated serum proteins are an artifact of tissue processing.

Panel b is a more distal section of the left uterine artery of sheep B183. Although the arterial wall is more irregular in organization and the lumen is smaller than in Panel 16a, the presence of red blood cells indicates that there was blood flow through this portion of the artery.

Panel c is a more distal section yet of the left uterine artery of sheep B183. The arterial wall is even more irregular in organization than in Panel 16b and the artery was occluded in this micrograph with no evidence of red blood cells to indicate blood flow. Note that there are small arterioles (arrow) around the occluded artery that supplied blood to the surrounding tissue. Fibrous connective tissue was not observed in any OCL 503-treated artery twelve months after implantation.

Sheep 183 treated left uterine artery (x200)

Figure 17. Histopathological Identification of Occlusive Events

they were implanted. OCL 503 microspheres were also found in the untreated contralateral uterine vasculature ($1/12 = 8\%$). Embosphere® Microspheres were detected in a larger percentage of treated sheep in the contralateral uterine vasculature ($6/15 = 40\%$). In addition, Embosphere® Microspheres were identified in the vaginal ($10/16 = 63\%$), ovarian ($2/16 = 13\%$) and urinary bladder ($1/16 = 6\%$) arteries. Results are only shown for the twelve OCL 503-treated sheep sacrificed by six months post implantation. The OCL 503 material was directly observed *in situ* through three months post implantation while treated blood vessels remained completely occluded six months after implantation. Data for the OCL 503-treated sheep sacrificed twelve months post implantation were excluded from this analysis since the treated arteries had either fully recanalized or were in the process of recanalizing.

It should be noted that a large number of Embosphere® Microspheres were found occluding the vaginal artery of sheep number Y184, while only a few were found within the uterine vasculature. This suggests that microspheres were originally implanted in the vaginal artery rather than the uterine artery in this animal.

A summary report for the gross post-mortem and histopathological findings for OCL 503 and Embosphere® Microspheres treatment groups is provided in Appendix W.

7. Discussion

This preclinical study examined the safety and efficacy of OCL 503 implanted in the uterine arteries of female Suffolk cross sheep. Embosphere® Microspheres, a commercially available artificial embolization device, was used as the control agent.

OCL 503 microspheres were suspended in saline and contrast medium (Appendix C1) and the resulting suspension of microspheres was delivered to the target vasculature through standard microcatheters. Any blockages of the microcatheters were easily cleared by simple flushing. Embosphere® Microspheres were resuspended per manufacturer's instructions and delivered to the target vasculature through standard microcatheters. Figure 11 shows the appearance of the microspheres pre-implantation.

An interventional radiologist implanted the OCL 503 and Embosphere® Microspheres artificial embolic devices in all thirty-two sheep in this study. The radiologist noted that the OCL 503 microspheres were more reliably and consistently suspended in saline and contrast medium than Embosphere® Microspheres and that the OCL 503 microspheres were very easy to administer.

It took significantly longer to surgically implant (time from insertion of the catheter to its removal) OCL 503 than Embosphere® Microspheres (18.4 ± 2.7 versus 9.6 ± 3.2 minutes; $p=0.0002$; Table 4). However, this is misleading as much of this difference is due to time taken suspending and testing OCL 503 in different total volumes (at the same 3:1 ratio of saline and contrast agent). Time was also taken to determine how to best administer OCL 503. This is supported by the determination that there was no statistically significant difference in the fluorographic time required to achieve effective stasis for either OCL 503 or Embosphere® Microspheres (8.9 ± 2.7 versus 8.1 ± 3.6 minutes; $p=0.32$; Table 5). Interestingly, there was no statistically significant difference in the number of vials of OCL 503 and the number of syringes of Embosphere® Microspheres required to achieve effective stasis (0.8 ± 0.3 versus 0.9 ± 0.3 vials; $p=0.31$; Table 6)

There were no indications of local or systemic toxicities. Changes observed in hematology (lymphocyte and neutrophil numbers [Figures 3 and 4]), clinical chemistry (BUN/Cr ratio, sorbital dehydrogenase-AO, ALT and AST [Figures 5 to 8]) and coagulation parameters (partial thromboplastin and prothrombin times [Figures 9 and 10]) were detected one day following surgery and generally resolved by seven days post surgery. Further, the changes were observed in both treatment groups, indicating that the changes were due to the anesthesia and stress of surgery rather than the implantation of either device. Fluctuations in laboratory parameters remained within the pre-treatment reference range established for the thirty-two sheep in this study. Fluctuations were generally not observed for the same parameter on consecutive sampling days.

Implanted OCL 503 microspheres underwent profound shape changes by one month post implantation (Figure 12a) as they were compressed and began to undergo biodegradation. Three months after implantation, the residual OCL 503 material was highly deformed and

compressed in the center of the artery (Figure 13a). There was no detectable OCL 503 material present by 6 months post implantation (Figure 14a).

Fibrous connective tissue formed around and between the OCL 503 microspheres. The connective tissue formed a matrix that helped hold the microspheres in place as they degraded (Figures 12a [one month post implantation] and 13a [three months post implantation]). The fibrous connective tissue replaced the inner luminal wall of the artery and maintained a complete occlusion of the treated artery despite the complete disappearance of the OCL 503 microspheres (Figure 14a [six months post implantation]).

Arteries treated with OCL 503 microspheres were either fully recanalized (Figure 15a) or were in the process of recanalizing (Figure 16) one year after implantation. The fibrous connective tissue observed earlier had completely resolved and the treated arteries either had normal morphology or were undergoing final tissue reorganization as they recanalized. In contrast, arteries treated with Embosphere® Microspheres were still fully occluded one year after implantation (Figure 15b).

OCL 503 microspheres were found in the lumen of the treated uterine artery and the branches of the artery as distal as the wall of the uterus along the mesenteric attachment (Figure 17). The OCL 503 microspheres were also found in the untreated contralateral uterine vasculature in one animal (1/12 treated sheep = 8%; Figure 17). The presence of OCL 503 microspheres in the untreated contralateral uterine vasculature most likely represents transit of the OCL 503 microspheres through an arterial anastomosis.

Embosphere® Microspheres had a similar qualitative distribution to OCL 503 in the treated uterine vasculature (Figure 17). Embosphere® Microspheres were detected in the contralateral uterine vasculature in 40% of treated animals (Figure 17). The high incidence of Embosphere® Microspheres in the untreated contralateral uterine vasculature supports the hypothesis of the embolic agents transiting through an anastomosis. Furthermore, Embosphere® Microspheres were detected in the vaginal (63%), ovarian (13%) and urinary bladder (6%) vasculatures (Figure 17). This suggests that Embosphere® Microspheres were more buoyant than the OCL 500 microspheres and migrated more readily to the other vasculatures.

Occlusin® 503 AED was found to be safe and effective as an embolotherapeutic agent as tested. Additional work is warranted with this device.

8. Conclusions

Primary Objective:

- (a) OCL 503 was safe and effective for use as an artificial embolization device as tested.

Secondary Objectives:

- (a) OCL 503 microspheres showed signs of particle remodelling one month after implantation. The remodelling was the result of the OCL 503 microspheres undergoing biodegradation and reabsorption. The OCL 503 microspheres continued to biodegrade with time. There was no evidence of residual OCL 503 material 6 months after implantation.
- (b) No significant systemic toxicity was observed in any treated animal. Transient changes in hematology, clinical chemistry and coagulation parameters were due to anesthesia and surgery rather than implantation of OCL 503. Fibrous connective tissue that formed around the implanted OCL 503 microspheres had completely resolved by one year after implantation.
- (c) Implantation of OCL 503 caused no detectable infarction to the uterus of any treated animal.
- (d) Uterine arteries treated with OCL 503 remained completely occluded six months after implantation. Recanalization of arteries in OCL 503-treated sheep was observed by twelve months after device implantation. The arteries of sheep treated with Embosphere® Microspheres did not recanalize.
- (e) OCL 503 was readily and consistently suspended to neutral buoyancy in contrast media and Sodium Chloride for Injection USP. The resuspended device was found to be easily administered through standard microcatheters.

¹D -1 = Day -1, Wn = Week n, Mn = Month n.

²Weight of the individual animals in kilograms on the specified time post embolization.

³Data Not Available

⁴Animal G186 was sacrificed 7 weeks post embolization due to a cervical lesion unrelated to treatment with OCL 503

¹ Not Reported² Not Applicable to calculate Mean and STDEV (These data are given in Tables with clinical data for individual animals)³ The values in bold were reported as being >60 (Appendix H, Clinical Laboratory Data for Individual Animals).

Since the true value is unknown, they are given here as “60” for the purposes of calculating mean and standard deviation.

¹ Not Reported² Not Applicable to calculate Mean and STDEV (These data are given in Tables with clinical data for individual animals)³The values in bold were reported as being >60 (Appendix H, Clinical Laboratory Data for Individual Animals).

Since the true value is unknown, they are given here as "60" for the purposes of calculating mean and standard deviation.

¹ Not Reported² Not Applicable to calculate Mean and STDEV (These data are given in Tables with clinical data for individual animals)³The values in bold were reported as being >60 (Appendix H, Clinical Laboratory Data for Individual Animals).

Since the true value is unknown, they are given here as "60" for the purposes of calculating mean and standard deviation.

¹ Not Reported

² Not Applicable to calculate Mean and STDEV (These data are given in Tables with clinical data for individual animals)

³The values in bold were reported as being >60 (Appendix H, Clinical Laboratory Data for Individual Animals).

Since the true value is unknown, they are given here as "60" for the purposes of calculating mean and standard deviation.

¹ It was impossible to perform an analysis of microspheres and occlusive events as the arteries of OCL 503-treated sheep were recanalized or in the process of being recanalized twelve months post implantation.

² DNE = Did Not Examine

Appendix W. Summary Gross Postmortem and Histological Report for Sheep Implanted with OCL 503 or Embosphere® Microspheres

ONE YEAR GROSS POSTMORTEM AND HISTOPATHOLOGY

The gross and microscopic postmortem findings at one year were clearly different between OCL 500 and Embosphere® Microspheres experimental groups. Upon gross examination of all Embosphere® Microspheres treated sheep, the treated uterine artery stood out as a thick, rope-like cord in the mesometrium, unchanged from its appearance at all of the previous examination periods. In two sheep, the vaginal artery on the injected side had a similar appearance. In contrast, the uterine arteries of all of the OCL 500 treated sheep were grossly normal, and the treated artery of each animal could not be distinguished grossly from the untreated artery.

Microscopic examination yielded similar results. Sections of uterine arteries from all embosphere treated sheep had the lumen completely obstructed by Embosphere® Microspheres. There was a well developed interstitial collagenous matrix which held the Embosphere® Microspheres in place, and occasionally, smooth muscle from the arterial wall also invested the Embosphere® Microspheres. There was no evidence of degradation of Embosphere® Microspheres in the year since injection. Small numbers of lymphocytes were occasionally present in places in the connective tissue among the Embosphere® Microspheres, but it was fibrosis and not inflammation that was the characteristic of the material in the arterial lumen. In contrast, the injected uterine arteries of three of the four OCL 500 animals could not be differentiated microscopically from the untreated arteries at any point along the length of the artery and its branches in the mesometrium to its ramifications in the outer wall of the uterine horns. In the fourth OCL 500 animal, segments of uterine artery in the mesometrium had varying amounts of fibrous tissue in the arterial wall, or areas of the wall that were irregular in organization. However, in almost all of these segments, there was a clear arterial lumen lined by endothelial cells which contained fresh erythrocytes, confirming blood flow. The diameter of many of the branches of the uterine artery in the mesometrium of this latter animal was not as great as in the other three animals of this treatment group.

OVERALL HEMATOLOGY AND CLINICAL CHEMISTRY

Over the entire study there were no differences at any time point between the OCL 500 and Embosphere® Microspheres treated groups of sheep in any of the hematologic and clinical chemistry parameters that were studied. Many sheep had a post surgery alteration in total white cell count and fluctuations from normal in the differential counts of individual leucocyte types, as well as slight alterations in serum electrolytes and variable elevations in creatine phosphokinase and liver enzymes. Such changes were part of the normal effects of, and physiological response to, anesthesia and the physical manipulations of surgery, and parameters almost always returned to normal by seven days post surgery. One animal had elevated muscle enzymes and phosphorus accompanied by clinical signs of stiffness, and was removed from the study early. This animal was found to have an abscess in a cervical vertebral

body, and the changes in clinical chemistry parameters were secondary to the effects of this upon the musculoskeletal system. A second animal had elevated muscle enzymes and its condition was followed by the collection of blood and serum samples at time periods additional to those called for in the study protocol. These parameters eventually returned to normal ranges without any accompanying clinical signs, and their cause was not determined. This animal was normal at the termination of the study by gross and microscopic postmortem examination.

In neither of the latter animals was the alteration in hematologic and clinical chemistry parameters related to the test article, either temporally or, in the animal with the spinal abscess, by examination of the lesion.

In this study there were pseudo-deviations from normal values for certain parameters on both the hematologic and clinical chemistry panels. This was a factor related to the reference laboratory, which was using textbook values for sheep rather than values determined on their own equipment with blood from sheep in the region in which this study took place. When the pre-experimental hematologic and clinical chemistry values for all the sheep in this study are taken as a normal group, these apparent deviations disappear. The individual deviations and their significance are discussed for each animal on the individual interpretation sheets for each blood sample.

BUSINESS ADDRESS:

Radiology and Diagnostic Imaging
Walter C. Mackenzie Health Sciences Centre
University of Alberta Hospital
8440 – 112 Street
Edmonton, Alberta
Canada, T6G 2B7

CITIZENSHIP:

Dual - British/Canadian

AGE:

45 Years

EDUCATION:

1987: University of Wales College of Medicine, Wales, MB b Ch
1991: Royal College of Physicians, England, MRCP (UK)
1996: Royal College of Radiologists, England, FRCR (UK)
1997: Royal College of Radiologists, England, CCST
2001: Medical Council of Canada, LMCC

LICENCES: College of Physicians & Surgeons of Alberta (2000) No: S09603
General Medical Council, London (1987) No: 3257166

RADIOLOGY RESIDENCY: Leicester teaching hospitals training scheme: 1991-96.

FELLOWSHIP TRAINING: Interventional Radiology, Calgary, Alberta; 1996-97

WORK EXPERIENCE:

June 2003-Present University Appointment: Assistant Professor, Department of Radiology and Diagnostic Imaging, Faculty of Medicine, University of Alberta, Edmonton, Canada. Staff Radiologist (Specialist Intervention), Medical Imaging Consultants, Edmonton.
Feb 2000 – Present Departments of Radiology; Grey Nuns Hospital, Royal Alexandra and University of Alberta Hospitals.

During my time in Edmonton I have continued my research interests and development of interventional radiology. I have introduced several new techniques (such as hepatic artery chemoembolization, radioembolization and pre-op portal vein embolization) and further developed established techniques (Broviac catheter placement, portacath placements, uterine artery embolization and gonadal vein embolization). I am actively involved in the clinical islet cell programme, was responsible for the Journal club for 2 years, act as the director for the fellowship programme and the mentor for the interventional fellow. I am the chairman of the regional Angio-interventional subgroup and represent radiology at the GI tumour group and the transplant group.

Jul 1997 –Jan 2000 Consultant in Radiology (Specialist intervention), Freeman Hospital, Newcastle, UK.
Academic appointment: Clinical Lecturer.

The Freeman Hospital has one of the largest vascular units in the UK and is a tertiary care center for several specialities. The hospital also houses the Northern region Liver and renal transplant services. The interventional service encompasses all specialties and modalities and during my appointment I consolidated my clinical experience in all areas.

During the post I set up a Central Venous line placement service, initiated the fellowship programme, became actively involved in the endovascular aortic stent trial and in the TIPSS trial.

Together with my colleague Dr Rose we established the Freeman as a training site for the Cook aortic endograft and ran several training courses.

I set up 2 randomised trials involving central venous catheter placement and subintimal angioplasty and was the college tutor for the 8 trainees attached to radiology.

In addition to the interventional commitment I had sessions in ultrasound, CT, General reporting and bariums as well as shared time in MRI.

Areas of Clinical experience:

- a) Diagnostic arteriography and venography in all areas (including neuro-radiology)
- b) Arterial and venous angioplasty, vascular stents, thrombolysis and embolisation techniques.
- c) Specialist procedures in renal and mesenteric domains.
- d) Placement of central venous catheters, dialysis access and A/V fistulae maintenance.
- e) Cholangiography, hepatic chemo and radio embolisation, stent placements and portosystemic shunts.
- f) Aortic stent grafts
- g) Biopsy and drainage procedures
- h) Specialist urological procedures
- I) Combined procedures in Interventional theatre
- J) Gynaecological interventions including uterine artery embolization.
- K) Islet transplantation

INVITED PRESENTATIONS / VISITING LECTURER

Canadian Association of Medical Radiation Technologists. Lectures on Ultrasound guided injection of pseudoaneurysms & Vascular stents: Calgary, Alberta June 2001

Leicester Royal infirmary (UK); Lecture on Islet cell transplantation in diabetes and teaching sessions with residents. Visiting Lecturer July 2003

Radiological Society of North America. Invited speaker on Islet cell transplantation Chicago December 2003

Society of Interventional Radiology. Moderator scientific session (Hepatic Interventions) Phoenix March 2004

Alberta Society of Radiation Technologists. Speaker Edmonton (Islet cell transplantation in diabetes) May 2004

Cardiovascular and Interventional Society of Europe. Invited speaker Barcelona (Hepatic intervention session) Sept 2004

Calgary. Resident research day Invited speaker (thrombosed dialysis access management) and judge May 2005

Canadian Interventional Radiology Association. AGM Company sponsored forum (Cutting balloon) June 2005

Society of Interventional Radiology. Invited speaker Toronto (Contrast nephropathy a radiologists perspective) March 2006

Winnipeg Endovascular Forum. Invited speaker (Cutting balloon) June 2006

Society of interventional radiology. Invited speaker on islet cell transplantation. Seattle March 2007

Winnipeg Endovascular forum. Invited Speaker on Endovascular treatment of trauma and upper limb interventions. Apr 2007

Canadian Interventional Radiology Association. AM Organizer and Invited speaker on thrombolysis in renal access grafts and on the use of glue in IR. May 2007

Canadian Interventional Radiology Association. AM Organizer and Invited speaker on Use of contrast agents in renal failure and complicated case presentations. May 2008

Cross Cancer Institute. Invited speaker on vertebral body augmentation. June 2008

GRANT APPLICATIONS / FUNDING / AWARDS:

Principle Investigator - Pump priming grant from the Royal College of Radiologists 1999 (£6000) Subintimal Angioplasty Versus Conventional Intra-Luminal Angioplasty In Superficial Femoral Artery Occlusions. Owen RJT, Lees T, Rose JDG.

Principle Investigator - Char Amersham award 2003 (\$12000). Portal Vein Embolization Of Radiolabelled Polyvinyl Alcohol Particles In A Porcine Model.

Co-investigator – National Cancer Institute of Canada; Operating grant. 2004 Novel Intravesical Molecular Therapy for superficial Bladder Cancer.

Co-Investigator – Alta Chem Pharma; Operating grant. 2004 Development of Hypocrellin B SO17 for Photodynamic Therapy (PDT) of Prostate Cancer.

Co – Investigator - ViRexx Medical Corp. Operating grant. Development of new embolotherapeutic agent – A Preclinical Study of the safety and Efficacy of OCL-501 in a porcine splenic infarct model.

Site principle investigator in multinational multicentre trial – Phase III study of Ytrium labeled particles in embolization in advanced HCC – Nordion MDS sponsor.

Principle investigator - local trial – Animal safety study of a new embolic agent, ViRexx Corp/ sponsor (\$50,000)

Site PI CORAL (NIH Study) Cardiovascular outcomes in renal artery lesions. NIH sponsored

Co-Investigator (P Tandon) Pro biotics and their effects on portal pressures. Local funding

I have also been able to gain funding from several commercial companies to assist ancillary staff in attending educational meetings as well as assisting in the procurement of funding for the radiology research nurse programme.

RESEARCH IN PROGRESS:

Embolization of traumatic uterine AV malformations

Portal vein embolization of radiolabelled polyvinyl alcohol particles in a porcine model

The use of von Willebrand factor as an embolization agent in an animal model

The use of a novel embolic agent in an animal model

The use of tissue adhesive in percutaneous islet cell transplantation procedures

Long term results of angioplasty in hemodialysis fistula using the ‘cutting balloon’

Radioembolization, trans arterial Chemoembolization in liver tumors

Photodynamic therapy

SOCIETY MEMBERSHIPS:

Royal College of Radiologists (UK), since 1991

Royal college of Physicians (UK), since 1991

British Society of Interventional Radiology, since 1995

Society of Interventional Radiology, since 1996

Cardiovascular and Interventional Radiological Society of Europe, since 1998

Alberta Medical Association, since 2000

Canadian Medical Association, since 2000

Canadian Interventional Radiology Association, since 2001

NATIONAL BODIES:

Treasurer for Canadian Interventional Radiology Association, since June 2004

Programme Chair 2007 AGM Canadian interventional Radiology Association – Banff Alberta, Canada

Programme Chair 2008 AGM Canadian interventional Radiology Association – Montreal, Quebec, Canada

Recreational activities:

Soccer player and coach, Golf, Squash, Swimming, Snow boarding, Gardening and fishing

WORK EXPERIENCE:

| | |
|--|--|
| June 1 1974 - May 31, 1976 | Professional Associate I Dept of Veterinary Pathology Western College of Veterinary Medicine University of Saskatchewan Saskatoon, Sask. S7N 0W0 |
| July 1 1976 - Sept 1 1976 | Visiting Veterinary Pathologist Department of Pathobiology University of Connecticut, Storrs, Connecticut USA |
| Term academic veterinary diagnostic position | |
| Oct 1976 - Sept 1980 | Veterinarian II Animal Health Division Alberta Agriculture: Fairview (1976 - 1978) Airdrie (1978 - 1980) |

A service/training position performing duties in general veterinary diagnostic pathology, all species, high component of comparative pathology/physiology

Veterinary diagnostic pathology position having service, educational and research components. All species were examined with emphasis on food producing animals, horses, pets and zoo species.

Sept 1980 - Feb 1985 Head, Regional Animal Health Laboratory
Animal Health Division
Alberta Agriculture
P.O. Bag 1
Airdrie, Alberta T4B 2C1

Veterinary diagnostic pathology position supervising a staff of ten permanent and up to five part-time employees in addition to performing service, educational and research activities as previously.

Feb 1985 - July 1987 Fellow of the Alberta Heritage Fund for Medical Research
Dept of Pharmacology and Therapeutics
Faculty of Medicine, University of Calgary
3330 Hospital Drive N.W.
Calgary, AB T2N 4N1

Research position held while conducting neurotoxicology study for PhD thesis. Thesis title "Drug Interactions on Neuronal Membranes."

July 1987 - Dec 1991 Head, Pathology Branch
Alberta Agriculture O.S. Longman Bldg
6909 - 116 Street
Edmonton, AB T6H 4P2

Middle management position supervising six laboratory managers and a laboratory scientist at four separate locations in the province. Total staff size of 41 permanent positions. Budget \$2.1 million.

Dec 1991 – Dec 1999 Comparative Pathologist
Health Science Lab Animal Services
Room 140 Heritage Medical Research Centre
University of Alberta, Edmonton, AB T6G 2S2

President Veterinary Pathology Laboratory
9520 – 27 Avenue, Edmonton, AB T6N 1B2

Full time service position in lab animal services in the University of Alberta providing diagnostic assistance and advice to medical researchers concerning laboratory animals. Professional services were sub-contracted by the University of Alberta to Veterinary Pathology Laboratory, a private veterinary diagnostic laboratory servicing North-central Alberta. This particular contract involved providing clinical pathology and anatomic services to veterinary practitioners concentrating on the traditional companion animal and food producing species but also including exotics, lab animals and avians.

1999 – Present

3330 Hospital Drive N.W.
Calgary, AB T2N 1N4
Adjunct Associate Professor,
Dept of Pathology and Laboratory Medicine,
University of Alberta
Edmonton, AB T6G 2S2

ACADEMIC COMMITTEE ACTIVITIES:

- 1989 - 1992 Member of two graduate student committees at University of Calgary.
- 1990 - 1991 Executive secretary of Alberta Agriculture Research Institute "Poultry, Pork and other livestock" research grant scientific review committee.
- 1990 - 1991 Northern Bison Management Board.
- 1992 – Present Animal Health Technician Program Advisory Committee, Lakeland College, Vermilion, Alberta.
- 1993 – 2005 Member of the Faculty (of Agriculture) Animal Policy and Welfare Committee, University of Alberta
- 1998 - 2005 Member of the University (of Alberta) Animal Policy and Welfare Committee
- 1999 - 2005 Member of the Health Sciences Animal Policy and Welfare Committee

PROFESSIONAL ASSOCIATION ACTIVITIES:

A. PAST

- 1973 President of Western Veterinary Medical Students' Association.
- 1974 - 1976 Member of Saskatchewan Veterinary Medical Association.
- 1974 - 1976 Member of Public Relation Committee, Saskatchewan VMA
- 1978 - 1982 Chairman of Continuing Education Committee Alberta VMA
- 1983 Academic Program Chairman for the Canadian Veterinary Medical Association annual convention.
- 1974 - 1981 Member of Wildlife Disease Association
- 1974 - 1982 Member of American Veterinary Medical Association
- 1984 President, Canadian Association of Veterinary Pathologists
- 1988 President, Western Conference of Veterinary Diagnostic Pathologists
- 1994 President of Western Conference of Veterinary Diagnostic Pathologists
- 1999 Chairman of Practice Inspection Committee, Alberta, VMA

B. PRESENT

- Licensed to practice veterinary medicine in Alberta.
- Member of Canadian Veterinary Medical Association 1974 to present.
- Member of Alberta Veterinary Medical Association 1977 to present.
- Member of Canadian Association of Veterinary Pathologists 1976 to present.
- Member of American College of Veterinary Pathologists 1980 to present.
- Certified specialist in veterinary pathology, CVMA, 1981 to present.
- Member of Canadian Association of Laboratory Animal Science 1995 to present
- Member of Canadian Association of Laboratory Animal Medicine 1995 to present
- Member, Registration Committee, Alberta VMA
- Member, Council of the Alberta VMA

Appendix Y. Revisions

Original Report Date: 2 September 2008

| Date | Comments | Initials |
|-----------|---|----------|
| 12 Nov 09 | <p>Changes to the report:</p> <ol style="list-style-type: none"> 1. specified the catheters used for embolization, 2. added a description of the process for selecting R/L uterine artery for treatment 3. clarified that jugular cannulation is for the purpose of administering a saline drip during surgery and is not part of the embolization procedure (and that the cervical abscess associated with the jugular cannulation of sheep G186 is unrelated to treatment with OCL 503) 4. specified that sheep G186 was sacrificed at week 7 post treatment, 5 weeks prior to its scheduled sacrifice at 3 months post treatment, in accordance with guidelines for the humane care and use of research animals 5. changed the report date, version number and sponsor company, and 6. Corrected typographical and minor formatting errors. <p>Changes were made in response to an external review by a regulatory consultant.</p> | |
| 1 Dec 11 | <p>Changes to the report:</p> <ol style="list-style-type: none"> 1. corrected the dose of Excenel per 20 May 10 email from B. Tchir 2. corrected typographical and minor formatting errors, and 3. changed the report date and version number | |
